

The purpose of the split platform is to improve the operation of process lines with single-wire or multi-wire saws. Specifically, its purpose is to transport the charging cars with the stone to the machine and collect them after cutting for further handling of the stone. The solution is particularly useful for several machines or for multi-wire saws while it is unprofitable with a single-wire saw.

The platform is fitted with an inverter of the main motor, which is also used for controlling the cars.

Device power - platform	2.2 kW
Device power – transport cars with the PL 180 single-wire saw	2.2 kW
Track length	depends on the number of machines
